Remote Access Key

Remote access keys allow you to log in to your server without the need for a password. You can use a remote access key (or access hash) to authenticate with WHM's [remote API](#) or DNS clustering features. If you use a remote billing solution, you will need to set up a remote access key on all of your cPanel & WHM servers. Read our [documentation](#) for specific information about how to use remote access keys.

Warning: This interface is [deprecated](#) and will be removed in a future release. We strongly suggest that you use the [Manage API Tokens](#) interface.

Access Key For User "root"

Generate a new access key.

You may generate a new access key here. When you generate a new remote access key, you will invalidate any existing remote access key. If you generate a new key, systems that use the existing key will no longer be able to connect.
