## Resolver Configuration

## Step 2

Enter the IP addresses of at least two nameservers that you will use for DNS resolution. Your datacenter should be able to provide you with at least one IP of a DNS server you can access. If you do not know the IP address of your provider's local resolvers, you should contact them. It is very important that these nameservers are correct, or your server will not function properly. If you do not know what to put in the boxes below and cannot contact your provider, please close this window and go through this setup at a later time. Your server should still function normally; however, connections made to the server may be slower than normal.

Primary Resolver

Secondary Resolver

Tertiary Resolver (optional)
